# Introduction to Security and Security Objectives

## Introduction

Cybersecurity and information security are centered around protecting data and systems against unauthorized access, modification, and disruption. The foundational framework guiding this protection is known as the **CIA triad**—Confidentiality, Integrity, and Availability. This model, along with supporting security principles and controls, is pivotal for organizations seeking to safeguard information and maintain trust.

## The CIA Triad: Core Principles of Security

### 1. Confidentiality

**Definition:** Ensures that sensitive information is accessible only to authorized individuals.

**Purpose:** Prevents unauthorized disclosure of data.

**Implementation Methods:**

- Encryption of data at rest and in transit.
- Strong access control mechanisms (e.g., user permissions).
- Authentication measures such as multi-factor authentication (MFA).

### 2. Integrity

**Definition:** Assures that data remains accurate, trustworthy, and unaltered by unauthorized parties.

**Purpose:** Prevents unauthorized modification or destruction of data.

**Implementation Methods:**

- Hashing and digital signatures to verify data integrity.
- Access control lists (ACLs).
- Secure audit logs for tracking changes.

CYVITRIX LEARNING

### 3. Availability

**Definition:** Ensures that authorized users have access to information and systems when needed.

**Purpose:** Prevents disruptions in service caused by failures or attacks.

**Implementation Methods:**

- Redundant systems and backup solutions.
- Disaster recovery plans.
- Mitigation strategies for denial of service (DoS or DDoS) attacks.

## Types of Security Controls

To uphold the CIA triad, organizations implement various types of security controls:

### 1. Technical Controls

**Examples:** Firewalls, intrusion detection systems (IDS), intrusion prevention systems (IPS), encryption, anti-malware solutions.

**Role:** Directly protect systems and data from cyber threats.

### 2. Administrative Controls

**Examples:** Security awareness training, background checks, access policies.

**Role:** Define procedures and policies to ensure best practices are followed by personnel.

### 3. Physical Controls

**Examples:** Biometric authentication, surveillance cameras, physical access control systems.

**Role:** Protect physical locations and prevent unauthorized access to critical infrastructure.

## Additional Security Principles

### Authenticity

**Definition:** Confirms that users, devices, or systems are truly who or what they claim to be.

**Implementation:** Biometrics, cryptographic certificates, hardware authentication tokens.

CYVITRIX LEARNING

## Non-repudiation

**Definition:** Prevents individuals from denying their actions within a system.

**Significance:** Important for forensic investigations, legal accountability, and transaction validation.

**Implementation:** Audit logs, cryptographic signatures, and forensic tracking (e.g., one-time password (OTP) for high-value transactions).

# The D&D Triad: The Attacker's Perspective

While defenders strive for CIA, adversaries seek to undermine security via the **D&D triad**:

**Disclosure:** Unauthorized exposure of confidential data (e.g., through breaches, phishing, insider threats).

**Alteration:** Unauthorized modification or corruption of data (e.g., tampering with financial or medical records).

**Denial:** Disruption of access to data or services (e.g., DoS/DDoS attacks, ransomware).

# Assessing and Implementing Security

**Risk Assessment:** Identify threats to confidentiality, integrity, and availability relevant to the organization's data and services.

**Control Selection:** Choose appropriate technical, administrative, and physical controls tailored to identified risks.

**Continuous Improvement:** Security is an ongoing process of adapting to evolving threats—controls must be regularly assessed, updated, and enhanced.

# Importance of the CIA Triad in Practice

**Trust and Reliability:** Adhering to the CIA triad helps organizations foster trust among users and stakeholders (e.g., governmental systems managing sensitive records, financial institutions handling transactions).

**Business Continuity:** Maintaining availability and integrity prevents reputational and financial losses.

**Legal and Regulatory Compliance:** Effective security controls support compliance with laws and industry standards.

CYVITRIX LEARNING

# Summary

The CIA triad—confidentiality, integrity, and availability—forms the foundational framework for information security. Organizations use technical, administrative, and physical controls to uphold these principles, establishing secure and trustworthy systems. Additional concepts like authenticity and non-repudiation reinforce security reliability. Understanding how attackers target these principles (disclosure, alteration, denial) guides proactive defense strategies. Ultimately, cybersecurity is a dynamic, continuous process of risk assessment, mitigation, and improvement, ensuring data and services remain protected in an ever-evolving threat landscape.

# Introduction to Security and Security Objectives Quiz

## Questions

**1. Which of the following best represents the core principles of information security?**

A) D&D triad

B) CIA triad

C) AAA framework

D) OSI model

B

**2. What does the "C" in the CIA triad stand for?**

A) Control

B) Confidentiality

C) Compliance

D) Cryptography

B

**3. Which principle of the CIA triad ensures that information is accessible only to authorized individuals?**

A) Integrity

B) Availability

C) Confidentiality

D) Authenticity

C

**4. Which of the following is an example of a technical control?**

A) Security awareness training

CYVITRIX LEARNING

B) Biometric authentication

C) Firewalls

D) Access policy development

C

**5. What is the primary function of integrity in the CIA triad?**

A) To ensure data is available at all times

B) To prevent unauthorized access to data

C) To maintain the accuracy and trustworthiness of data

D) To authenticate users

C

**6. Which control type includes background checks and access policies?**

A) Technical controls

B) Administrative controls

C) Physical controls

D) Logical controls

B

**7. Which of the following is NOT a method to ensure availability?**

A) Redundancy systems

B) Backup solutions

C) Encryption mechanisms

D) Disaster recovery plans

C

**8. What principle ensures that users or devices are who they claim to be?**

A) Non-repudiation

B) Authenticity

C) Integrity

CYVITRIX LEARNING

D) Availability

B

**9. Which security objective is compromised if an attacker alters data within a system?**

A) Confidentiality

B) Integrity

C) Availability

D) Non-repudiation

B

**10. Which of the following is a physical control?**

A) Intrusion detection system

B) Security awareness training

C) Surveillance cameras

D) Hashing algorithms

C

**11. What is the purpose of non-repudiation in information security?**

A) To maintain the accuracy of data

B) To allow users to deny their actions

C) To prevent denial of service

D) To prevent individuals from denying actions they performed

D

**12. The D&D triad includes all of the following EXCEPT:**

A) Disclosure

B) Denial

C) Deterrence

D) Alteration

C

CYVITRIX LEARNING

**13. Which measure would most directly help prevent unauthorized disclosure of sensitive information?**

A) Backup solutions

B) Multi-factor authentication

C) Redundancy systems

D) Load balancing

B

**14. What type of control is an access control list (ACL)?**

A) Physical control

B) Technical control

C) Administrative control

D) Non-repudiation control

B

**15. Which of the following best exemplifies a loss of availability?**

A) Data breach

B) Unapproved data modification

C) DDoS attack causing service outage

D) Unauthorized financial transaction

C

**16. Which security principle is reinforced by audit logs and cryptographic signatures?**

A) Confidentiality

B) Non-repudiation

C) Integrity

D) Availability

B

**17. What is the main role of disaster recovery plans in information security?**

A) To enforce access control policies

CYVITRIX LEARNING

B) To ensure continued access to data after a failure

C) To prevent unauthorized access

D) To detect malware

B

**18. An organization that suffers repeated unauthorized data modifications is failing to uphold which principle?**

A) Availability

B) Authenticity

C) Integrity

D) Confidentiality

C

**19. Which of the following is NOT considered an administrative control?**

A) Security awareness training

B) Background checks

C) Access policy development

D) Encryption mechanisms

D

**20. What is the primary goal of cybersecurity as described in the lecture?**

A) To build new technologies

B) To protect information and systems from unauthorized access, exposure, modification, or disruption

C) To increase the complexity of IT systems

D) To ensure data is always public

CYVITRIX LEARNING

# Answers and Explanations

1. **Answer: B** - Explanation: The CIA triad (confidentiality, integrity, availability) is the core of information security.

---

2. **Answer: B** - Explanation: "C" in CIA stands for Confidentiality.

---

3. **Answer: C** - Explanation: Confidentiality ensures that only authorized individuals can access sensitive data.

---

4. **Answer: C** - Explanation: Firewalls are a technical control designed to detect and prevent cyber threats.

---

5. **Answer: C** - Explanation: Integrity ensures data remains accurate, trustworthy, and unaltered by unauthorized individuals.

---

6. **Answer: B** - Explanation: Administrative controls include policies, training, and background checks.

---

7. **Answer: C** - Explanation: Encryption mechanisms are for confidentiality, not directly for availability.

---

8. **Answer: B** - Explanation: Authenticity confirms identities of users, devices, and systems.

---

9. **Answer: B** - Explanation: Data alteration compromises the integrity of information.

---

10. **Answer: C** - Explanation: Surveillance cameras are a physical control for securing locations.

---

CYVITRIX LEARNING

11. **Answer: D** - Explanation: Non-repudiation stops individuals from denying actions they performed.

---

12. **Answer: C** - Explanation: Deterrence is not part of the D&D triad; it includes disclosure, alteration, and denial.

---

13. **Answer: B** - Explanation: Multi-factor authentication helps prevent unauthorized disclosure by strengthening access controls.

---

14. **Answer: B** - Explanation: ACLs are a technical control used to enforce access permissions.

---

15. **Answer: C** - Explanation: A DDoS attack that causes service outages is a loss of availability.

---

16. **Answer: B** - Explanation: Audit logs and cryptographic signatures support non-repudiation.

---

17. **Answer: B** - Explanation: Disaster recovery plans maintain availability after failures or attacks.

---

18. **Answer: C** - Explanation: Integrity is compromised by unauthorized data modifications.

---

19. **Answer: D** - Explanation: Encryption mechanisms are technical, not administrative, controls.

---

20. **Answer: B** - Explanation: The primary cybersecurity goal is protection from unauthorized access, exposure, modification, or disruption.
